

Substandard drinking water bottles identified in Karnataka: Government takes action

Synopsis: *The Karnataka Food Safety and Drug Administration (FSDA) recently revealed concerning results from an analysis of 296 bottled water samples conducted in February and March 2025. Among the findings, 72 samples were deemed safe, while 95 were unsafe and 88 substandard. Several brands were flagged for unsafe levels of Total Dissolved Solids (TDS), magnesium, calcium, and iron, posing health risks*

In a significant move to ensure public health and safety, the Karnataka Food Safety and Drug Administration (FSDA) has revealed alarming findings regarding the quality of drinking water bottles in the state.

After a recent analysis conducted in February and March 2025, a number of substandard and unsafe bottled water brands were identified. The analysis involved 296 drinking water bottle samples, of which 72 were found safe, 95 unsafe, and 88 substandard.
